Implementing Art. 6 of the Paris Agreement
Transfer Readiness Assistance (TRA)

Project Concept

A. Introduction and background

The Paris Agreement on Climate Change sets out a global action plan to put the world on track to avoid catastrophic climate change impacts. The agreement acknowledges that this effort will require a global peaking of greenhouse gas emissions as soon as possible and achieving climate neutrality by 2050. The transition to a low carbon, resource-efficient economy demands a fundamental shift in technology, energy, economics, finance and our behaviour as a global society. For Switzerland and UNDP, this provides important opportunities to develop their ongoing partnership, drive forward an economic transformation, create jobs and accelerate the low carbon transition.

It is estimated to cost US$ 4.4 trillion for developing countries to implement their Nationally Determined Contributions (NDCs), countries' pledges to the Paris Agreement, but these costs are constantly swelling as climate impacts progressively worsen. What is clear is that governments using public money will not be able to adequatelyaddress climate change with the limited funds they have. The vast majority of emission reduction activities need to be implemented and financed by private sector and businesses. These same activities will also help countries achieve other sustainable development objectives and countries' commitments to the Agenda 2030 and the Sustainable Development Goals (SDGs), as most climate solutions have multiple co-benefits for people and planet. For the world to give itself a chance to prosper in the midst of a global pandemic and political and economic uncertainty, it's essential to find innovative, effective and context-sensitive ways to stimulate and scale up investment and finance for NDCs and national development plans.

Many well thought-out and carefully designed plans are in place. It's now time to identify suitable finance approaches so these plans can be implemented. Article 6 of the Paris Agreement details a set of tools and mechanisms, such as cooperative approaches and the transfer of Internationally Transferrable Mitigation Outcomes (ITMOs), that can stimulate investments into mitigation activities and NDC implementation. Switzerland has been engaging on a bilateral basis with developing countries to develop an approach – in-line with the Article 6.2 of the Paris Agreement on ITMOs and the subsequently developed San Jose principles – that results in a cooperative relationship and a set of commercial transactions between the countries, yielding numerous climate mitigation and sustaianbel development benefits. Moreover, such an approach will allow

Switzerland and host countries to make progress on their respective international commitments to the Paris Agreement, accelerating its implementation.

B. Project Intervention Strategy

The following section describes what this technical assistance intervention entails, and how the project is embedded within UNDP's overarching energy and carbon finance framework.

The TRA project, alongside other initiatives, will contribute to achieving UNDP's Sustainable Energy and Carbon Finance Framework (from hereon reffered to as 'the sustainable energy framework'), with a core objective to support countries scale up sustainable energy solutions and enhance readiness for carbon markets and accelerate its implementation.

UNDP's Energy portfolio covers over 100 countries to harness clean energy across 180 active projects, with a total funding of more than $800 million in grant financing. The portfolio is set to have a significant climate impact, with an emission reduction potential of 290m tons of CO2 emission reductions. Since 2018, UNDP's work has provided 31 million people, with access to clean energy for both electrification and cooking.

UNDP supports countries in three key areas:

- **Access**: Off-grid electrification, Electrification of health facilities. Low-income countries
- **Transition**: Integrated urban planning, E-mobility, Energy Efficiency in buildings Middle-income countries
- **Resilience**: Electricity access, Private sector business models. Fragile & crisis settings

Supporting energy choices that work for people and planet is at the heart of UNDP's mission. Right now, countries face a critical decision: invest at scale in a socio-economic recovery driven by fossil fuels, doubling down on humanity's collision course with nature, or invest at scale in the future -- a green economy fueled by renewable energy – to reduce poverty and inequality as well as take a giant step towards ending the climate crisis no time to waste: the energy sector accounts for two-thirds of carbon dioxide emissions, and there are only nine years left to halve global CO2e emissions. The options for a just transition to a green future are known, but the choices made in the next few years will either accelerate or stall progress towards the next generation of jobs and infrastructure. A focus on SDG 7 - affordable and clean energy - can supercharge the Decade of Action and the realization of all SDGs which the world promised to meet by 2030. This is a once in a generation chance to set things straight.

To drive action and help countries meet their energy and climate ambitions, we are harnessing the power of financing and partnerships to achieve the just transition to a green future through five pillars:

1) Policy advisory services to enable clean energy investment: Design effective policies and regulations to enable clean energy investment.

2) Digital transformation and Artificial Intelligence for clean energy transition: digital tools that will enhance the ability of project proponents in developing countries to prepare bankable energy projects.
3) Innovative business models and financial instruments for energy access: Develop innovative business models and financial instruments to accelerate energy access, including performance-based payments and carbon financing.
4) Integrated approach - clean energy for the development of the SDGs and Paris Agreement: Help clients to tackle complex development challenges and achieve the SDGs and Paris Climate Change targets through SDG integration with clean energy.
5) Energy leadership: become a center of excellence for sustainable energy.

Within the sustainable energy framework sits the Carbon Payments for Development (CP4D) Facility which aims to promote ambitious climate action with a focus on energy-based mitigation approaches by supporting developing countries implement their climate plans, aligned with the Paris Agreement. Through a performance-based payments (PBPs) modality, the Facility will de-risk and incentivise private sector investments into projects that directly contribute towards countries' conditional NDCs. Through engaging partners across the value chain—from donors to local project developers—over its ten year lifespan, the Facility aims to reduce emissions by approximately 27 million tCO2e. By targeting a private sector-driven approach to NDC implementation, the Facility hopes to stimulate lasting changes to developing countries' economies and frontier markets and catalyse sustainable, low carbon development. By de-risking investments into climate projects, the Facility will create jobs and drive market growth to support a green recovery from the COVID-19 crisis. Recent research indicates speedy results and targeting project types that deliver both climate and economic goals are critical components to achieving green economic recoveries. The CP4D has been designed to do just that: deliver climate and social impacts quickly and at scale.

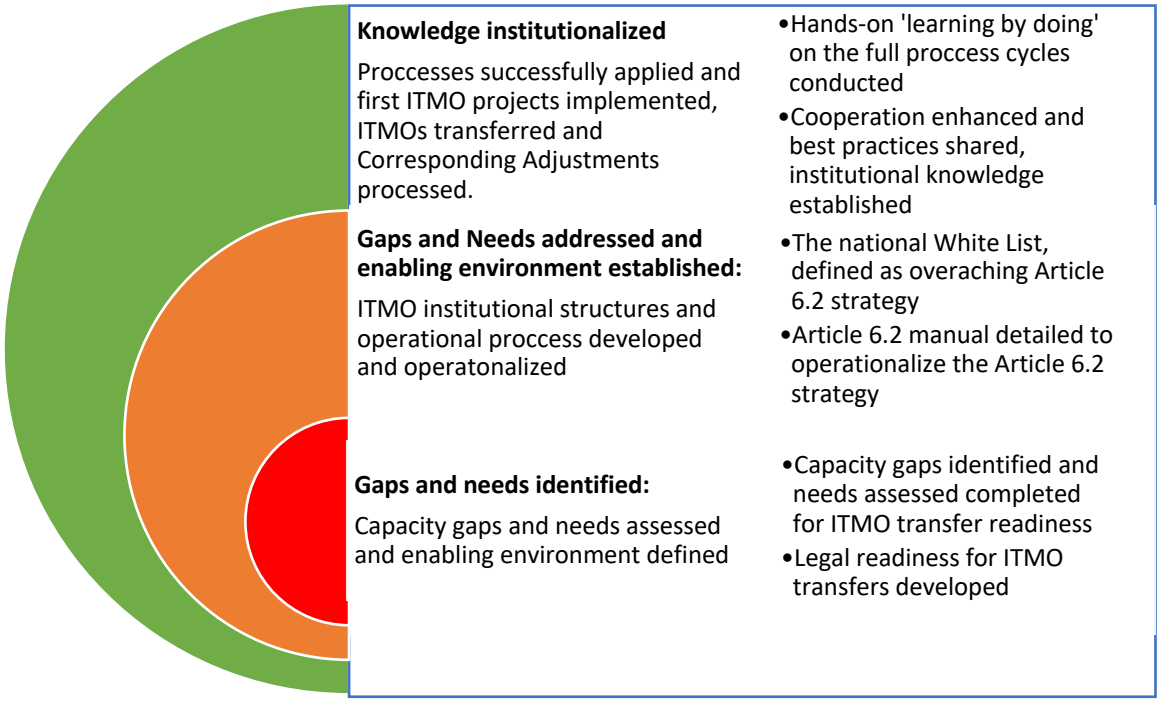

Alongside its core objectives of reducing emissions, mobilizing private green finance, providing value for money for donors, generating new projects in underserved communities, the provision of technical assistance to countries entering carbon markets is an essential element of the support the CP4D will offer to countries, to facilitate the achievements of the above listed objectives.

Through the collaboration with Switzerland, the CP4D aims to provide the technical assistance necessary to develop carbon market readiness, which will enhance countries' carbon market participation. The TRA project will provide technical assistiance in up to 6 countries targeted towards the following deliverables:

0. Assessment of capacity gaps and needs for ITMO transfer readiness
1. Development of the legal setting for Article 6.2
2. Strengthening of ITMO operational processes
3. Facilitation of a Digital Article 6.2 Platform to strengthen cooperation and enhance awareness of Article 6.2
4. Hands-on 'learning by doing' on the operationalization of the ITMO project cycle

Below figure visualizes the readiness support from the identification of gaps and support needs to fully institutionalized knowledge about ITMO processes. The 3 steps show how the project will provide the hands-on support through 'learning by doing' that is essential to successfully operationalize ITMO project implementation:

Figure 1: Capacity enhancement through Transfer Readiness Assistance

Intermediate Outcome: Capacity gaps and needs assessment for ITMO transfer readiness to identify countries' readiness and capacity building needs to develop and operationalize ITMO projects, track results and process the Corresponding Adjustments.

The World Bank PMR has developed a standardized framework to transparently help countries to identify gaps for their effective participation in international carbon markets. With the support of the Partnership for Market Readiness (PMR), the World Bank supported the development of the International Transfer Readiness (MAAP-ITR) tool to assess countries' level of readiness for Article 6.2 projects.

Under the TRA project, UNDP will apply the MADD-ITR moduls 'Party Readiness' and 'Article 6 implementation' to review if a country has set-up a robust institutional framework and infrastructure to effectively implement ITMO projects and will thereby determine the 'party readiness'. The overall objective of the assessment is to ensure that gaps are identified and the effectiveness of existing processes for international transfers of ITMOs evaluated. Based on the result of the assessment, the support needs will be formulated to fill the capacity gaps and ensure a smooth implementation of bilateral ITMO projects with Switzerland in the coming years.

UNDP has already collaborated with the World Bank on the piloting of the MAAP-ITR in several countries in Sub-Saharan Africa and documented the application process and related outcomes in a report with the World Bank.

Building on UNDP's previous positive experience with the application of the MAAP-ITR, UNDP will apply it systematically to deliver the following outputs/deliverables:

- Conduct the gap analysis of the existing capacities and needs immediately after start of the project. The assessment will also be conducted in countries where a previous MAAP assessment has been completed to ensure that also the latest capacity improvements and support received from UNDP, the World Bank PMR and other development partners is reflected.
- Identify scope and scale of required technical assistance to operationalize Article 6.
- Define the technical assistance activities needed and offered within the scope and timeframe of the TRA project to address the capacity gaps.
- Coordinate with other development partners to avoid overlaps and duplication and ensure syntergies.

Outcome 1: Legal readiness for ITMO transfers under the respective national laws

While the rulebook on implementation of the Paris Agreement was adopted at COP24, the set of provisions dedicated to the operationalization of Article 6 were not finalized. Within this context, with the expectation of a future agreement and implementation of the rules, some parties are piloting Article 6 activities and setting the foundations for initial trades. Switzerland is pioneering Article 6 cooperation among several countries and provides targeted readiness support to advance also the legal readiness of host countries to authorize, issue and transfer ITMOs. While bilateral cooperation commences, few countries have decided about the kind of infrastructure or framework which will be put in place to effect ITMO transfers. The enactment of domestic legislations that govern the engagement in carbon markets, will be of vital importance.

Therefore, it's critical that the legal capability of the countries to transfer the title of emission reductions to another government is carefully analysed to ensure that the Government has the authority to transfer the title in its own name and the authority to sign the emission reduction purchase agreement through a bilateral agreement with another government.

This TRA project will support countries with the following outputs, to ensure they are legally ready to engage in ITMO transactions with Switzerland under their respective national laws:

- *Institutionalization of Climate Change Policies:* Legal gap assessment and recommendations for inclusiveness of policies and laws, their embeddement in broader policy frameworks and assessment of distinctions between mitigation targets to achive the NDC goals and for international transfers.

- *Analysis of the legal capability of the country to transfer title to ITMO activity emission reductions and removals.* Review of the concept of ITMOs and the legal titles attached to them in the context of the national laws.
- *Review of Government authority to transfer ITMO titles.* This involves the review of transferability of carbon rights and the related procedures that set out specific rules for the transfer of titles to emission reductions from a public or private entity to another (or to the government). Recommendations and steps to pass the ownership of emission reductions contractually by parties and the development of prescribed forms.
- *Sectoral readiness for private sector engagement and direct cross-border investing.* Assessment of policies and laws for foreign private investment (equity and debt) into national companies and possibilities of public-private partnerships.

Outcome 2: Support establishment of ITMO operational processes to facilitate ITMO project selection, authorizations, implementation, ITMO transfers and related corresponding adjustments.

With a well-coordinated approach, the Article 6.2 market can be a catalyst to achieving the NDC goals and provide investment opportunities for businesses. The implementation of Article 6.2 will require countries to have robust policies and regulations and institutional arrangements and in particular also a national strategy for participating in Article 6.2 cooperation and clearly defined operational modalities for developing and implementing mitigation activities.

The modalities of the implementation of Article 6.2 cooperative approaches are up to the cooperating countries. Article 6.2 envisages the different roles of host and recipient countries in ITMO transactions. Transfers of Mitigation Outcomes will trigger corresponding adjustments of the host countries' NDCs and will require close attention by the authorities of the host countries to ensure the integrity and achievement of the NDC goals.

A 'White List' defined as overarching Article 6.2 strategy is expected to settle policy questions regarding the:

- relationship between NDC and mitigation activities to generate ITMOs;
- ensuring environmental integrity in transacting ITMOs;
- maximising sustainable development benefits;
- eligibility criteria for potential mitigation activities;
- clarity on the use of ITMOs;
- pricing and share of proceeds utilization;
- overall governance structure;
- linkages with voluntary markets, crediting schemes, Article 6.4 and CORSIA;
- standards and methodologies;
- Article 6.2 infrastructure;
- authorisation, corresponding adjustment and reporting;
- capacity development and awareness support.

The consequent operationalization of ITMO project implementations will be guided through an ITMO operational manual which will translate the policy provision into concrete operational guidance on the mitigation activity development and implementation related institutional procedures.

This project will support countries establish their operational process through delivering the following outputs:

- Review of the global state of carbon pricing policies and carbon markets and interlinkages between the NDCs and emerging post-2020 climate markets.
- Development of a national Article 6.2 strategy. This strategy will reflect the latest knowledge, experiences and practices at the international level. The strategy will address broader policy questions related to relationship between NDC and mitigation activities to generate ITMOs.
- Development of an ITMO operational manual that seeks to operationalize the Article 6.2 strategy and regulate the development and implementation of mitigation activities. The ITMO manual will address the following elements: (a) institutional arrangement for Article 6.2 ITMO project implementation; (b) mitigation activity development cycle; (c) approval procedures for ITMO project registration and ITMO issuances and transfers; (d) service fees, charges and payments; (e) criteria for methods and participating auditing entities, (f) standards and complaint redress; (g) associated templates.
- At least two stakeholder consultations during the development of the documents and a final validation workshop to approve the Article 6.2 strategy and ITMO operational manual.

Outcome 3: Digital Article 6.2 Platform to enhance cooperation between host countries and buying countries and strengthen countries' awareness about Article 6.2.

Article 6.2 activities follow a project cycle which is similar to earlier carbon markets under the Kyoto Protocol with the most prominent being the Clean Development Mechanism (CDM) with newly added steps such as the authorization and transfer of ITMOs and related corresponding adjustments. These processes follow certain universally applicable steps while other steps will be nationally determined for which countries will establish their national processes.

The national processes will include ITMO project authorization, monitoring, verifications and ITMO issuance, transfers and corresponding adjustments. UNDP will provide support to harmonize the processes through a digital Article 6.2 platform to align and streamline processes and facilitate cooperation between and among countries active in cooperative approaches as well as newcomers interested in engaging in cooperative approaches with Switzerland. The advantages of operationalizing a global digital platform with access rights for host and buyer countries are: (1) it will further improve transparency and comparability of Article 6.2 processes

and; (2) through awareness raising and information sharing also enhance participation of countries in emerging carbon markets.

While the platform will be established through other funding sources, up to 4 new countries and 3 components will be added to expand the utilization of the platform such as Peer to Peer interactions, a coded mobile app for enhanced user services and plausibility verifications during ITMO project implementation.

Furthermore, under this outcome, UNDP will raise awareness about opportunities and progress on Article 6.2 and communicate and disseminate success stories in English, French and Spanish through the Article 6.2 platform in multiple delivery formats. This will include an effective communication of the strengths and lessons learned from the individual Article 6.2 activities in each target country to garner whole of government support and replicate actions at global levels.

The projet will achieve these goals through the following outputs:

- Develop coding and mobile app features for Peer to Peer interaction on the digital ITMO platform for enhanced consumer services.
- Develop secure layers to introduce external parties' validation and verification of ITMOs.
- Establish connection features for external platforms such as the energy management platform Odyssey and impact investment platforms such as Trine to facilitate access to potentially necessary underlaying finance for ITMO project implementation.
- Development of at least 6 success stories in the target countries in English and the national (UN) language, where applicable.
- Participate in at least two conferences and/or webinars per year to disseminate best practices and lessons learned at national, regional and global level.

Outcome 4: Hands-on "Learning by Doing" on operationalization of the ITMO project cycle, use of emission transaction registries/Excel spreadsheets and application of corresponding adjustments.

The success of any carbon exchange programme depends on robust processes for implementation of ITMO projects and credible developer and project data that allows independent scrutiny at every level of ITMO project development and implementation. The stream of generated ITMOs must occur on a functional emission transaction registry or systematically applied Excel spreadsheet to ensure environmental integrity. Emissions are recorded in a database with serialised emission reduction units and other public information including vintages of emission units, identity and location of projects, project funders, and verification details.

The procedures for the implementation of ITMO projects will include (i) processes for project developers, (ii) project registration procedures, (iii) implementation of transaction registry

systems also in the form of Excel spreadsheets and the definition of different users, user rights and responsibilities to operate the systems.

UNDP will provide hands-on support to allow countries active learning by doing throughout the TRA project with the goal to fully operationalize the ITMO project cycle as well as the use of emission transaction registries where available and the application of corresponding adjustments. Through additional targeted trainings on the ITMO operational manual and the ITMO project processes, UNDP will ensure smooth ITMO issuances and ITMO transfers.

This will be achieved through the following outputs:

- Development of training materials for the ITMO operational manual and the emission registry/Excel spreadsheet.
- Provide hands-on support during the institutionalization of the ITMO project implementation processes and work closely with users in key roles and with key responsibilities for effective ITMO project implementation.
- On-going learning by doing will be provided for tracking of authorized ITMO projects, and issued and transferred ITMOs. For this, existing national registries will be used or simple Excel spreaksheets developed to ensure full ITMO project transparency.
- Conduct at least 4 targeted trainings per country for 4 key user groups: Lead ministry stakeholders, line ministries stakeholders, private sector stakeholders and national finance institutions.

C. Sustainability:

The TRA project will ensure sustainability of the processes supported by SECO and UNDP by building robust capacities of responsible institutions: Through a holistic approach, the project will look at the key institutional gaps and needs, the overall national legal requirements, establish the necessary processes and provide hands-on learning by doing during the implementation of the first ITMO projects. The newly gained capacity of national institutions will be applied for scaling-up carbon market activities beyond the project's current scope, expanding to other like-minded countries such as Sweden and Norway. The established processes and developed knowledge can then also be replicated in the voluntary carbon markets (VCMs). It has been seen in the past that informed governments are more likely to deliver transparent and easily accessible VCMs which will provide these countries additional streams of international climate finance and ultimately, contribute to their low carbon development pathways. The established processes will improve the quality of generated carbon credits through the established checks and balances. The target countries under this project will set the standards for new entries through knowledge sharing, success stories and tangible examples which will further the operatinalization of Article 6 of the Paris Agreement.

D. Risk Assessment

The overall TRA project implementation risk level is low. The risks identified are of political, operational and technical nature and it's important that during implementation there is sufficient flexibility to address them. The potential risks that might affect the implementation of the project are summarized below:

Table 1: Risks and risk mitigation measures

Risk	Risk Type	Riks Level	RkaMitigation Measures
Limited institutional absorption capacity and high staff turnover.	Operational	Low	Commitment to engage larger teams in each Ministry and Government institution to build bottom-up capacity.
Delays in ITMO project development and implementation.	Technical	Medium	Offer a wide range of support to ensure the needs of each country are met.
Lack of institutional engagement to effectively implement the measures identified in the gaps assessment	Political	Medium	Ensure participation of political leadership throughout project implementation to maintain high-level buy-in.

E. Implementation Arrangements

The global energy team will perform project management and project oversight, including overall responsibility for project planning processes, reporting functions and budget management. It will also provide support to UNDP Country Offices.

Implementation of activities in each target country will be led by the UNDP Country Office and overseen directly by each UNDP Country Office Envirnmental Team Lead. The global team will maintain the relationships with SECO HQ and the Country team will maintain the relationship with the SECO missions and provide activities updates to the missions as necessary. Synergies with other SECO supported programs will be generated whenever possible.

F. Donor Visibility

Visibility for SECO will be achieved through several mechanisms, including:

- Knowledge and learning disseminated through UNDP channels, as well as strategic partners including the World Bank and GGGI.

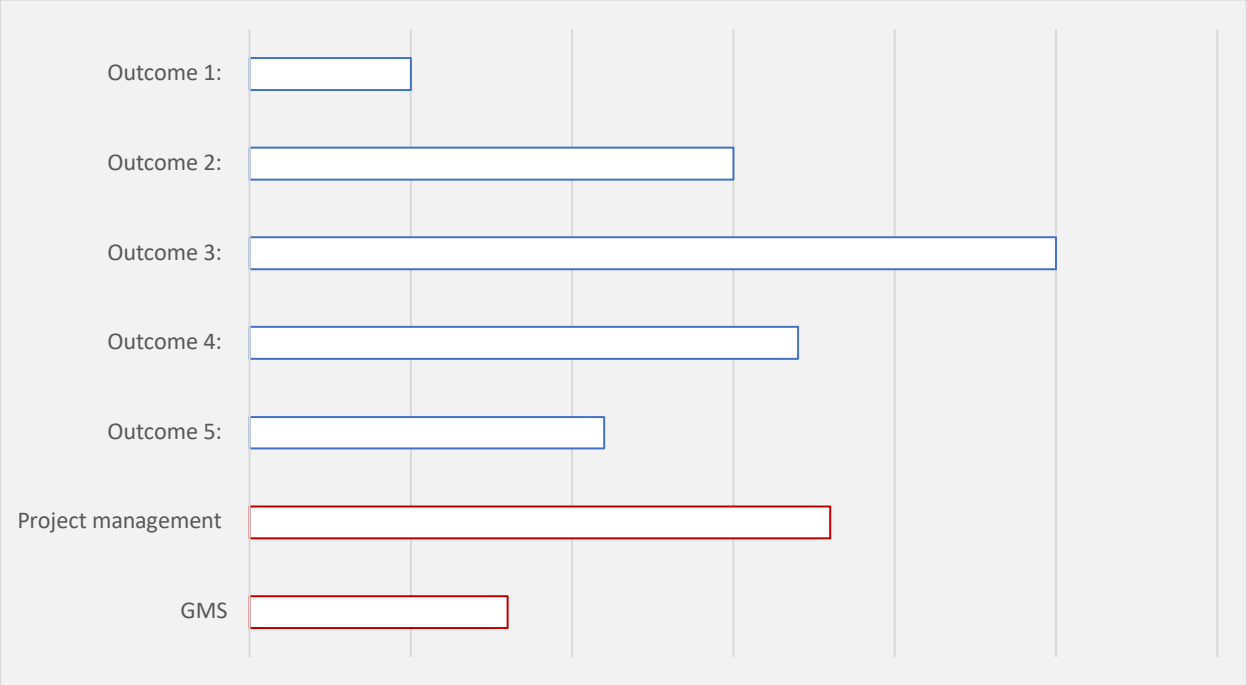

- Promotion of key results and best practices through global and regional fora including: the Regional Climate Dialogues and Innovate four Climate, national carbon market events and UNDP and joint UNDP-SECO webinars.
- Donor branding of key knowledge products.

Table 2: Budget overview per year

Preliminary budget breakdown per Outcome and project year (US$)				
	2022	2023	2024	**Total**
Intermediate Outcome: Capacity gaps and needs assessment for ITMO transfer readiness	13%	2%	0%	**5%**
Outcome 1: Legal readiness for Internationally Transferred Mitigation Outcomes (ITMO) transfers under the respective national laws	15%	12%	20%	**15%**
Outcome 2: Establishment of ITMO operational processes to facilitate ITMO project selection, authorizations, implementation, ITMO transfers and related corresponding adjustments.	23%	18%	30%	**25%**
Outcome 3: Facilitate cooperation between host countries and buying countries and ensure enhanced awareness of countries about Article 6.2 through a digital Article 6.2 Platform.	8%	31%	12%	**17%**
Outcome 4: Hands-on 'Learning by doing' Trainings on the operationalization of the ITMO project cycle, the use of emission transaction registries/Excel spreadsheet and application of corresponding adjustments.	10%	8%	13%	**11%**
Project management				**18%**

GMS				**8%**
UN Levy				**1%**
Total	**27%**	**33%**	**40%**	**1,480,800**

Figure 2: Budget distribution in percent per outcome

Annex 1: Logframe

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
Impact	**Impact Indicators**		
Project Objective: Enhanced institutional capacities for carbon market transactions.	Number of trained persons (disaggregated by gender and departments). **Baseline:** No person trained. **Target:** At least 50 persons trained in each country (minimum 1/3 female).	Training reports/participant lists	Countries' commitments to implement the bilateral agreements with Switzerland continues. KliK Foundation supports the preparation of ITMO projects efficiently.
Outcomes	**Outcome Indicators**		
Intermediate Outcome *Capacity gaps and needs analysed.*	*MADD-ITR moduls 'Party Readiness' and 'Article 6 implementation' applied and countries' institutional readiness assessed.* ***Baseline:*** *No MADD-ITR moduls applied.* ***Target:*** *Comprehensive MADD-ITR assessment conducted in each country and gaps and needs identified.*	*MADD-ITR assessment reports*	*Countries willing to provide necessary information and actively participate to complete comprehensive assessments.*
Outputs			
Outputs to achieve Intermediate Outcome 1.1 Scope and scale of required technical assistance identified.			-

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
1.2 Technical assistance activities defined. 1.3 Coordinated with other development partners to avoid overlaps and duplication and ensure syntergies.			
Outcomes	**Outcome Indicators**		
Outcome 1 Legal readiness for ITMO transfers developed.	Legal capability analysed and legal authority of governments for ITMO transfers defined. **Baseline:** Legal conditions not defined for ITMO projects. **Target:** Legal authority for transfer of titles to ITMOs defined in all countries.	Legal analysis and legal templates.	Countries willing to implement the legal recommendations to ensure ability to transfer titles to ITMOs in their own name.
Outputs			
Outputs to achieve Outcome 1 1.2 Government authority to transfer ITMO titles reviewed. 1.3 Recommendations and contractual steps to pass the ownership of emission reductions developed.			-

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
1.4 Sectoral readiness for private sector engagement and direct cross-border investing strengthened.			
Outcomes	**Outcome Indicators**		
Outcome 2 ITMO processes established.	**3a.** 'White List' developed as overarching Article 6.2 strategy to settle policy questions regarding the implementation of ITMO projets. **Baseline:** No overarching policy strategy exists. **Target:** Each participating country has developed an overarching strategy that clarifies key policy questions regarding the implementation of ITMO projets. **3b.** ITMO operational manuals established which translates the policy provisions into concrete operational guidance. **Baseline:** No operational manual that guides ITMO project implementation.	**3.a** Whitel list **3.b** ITMO manual (virtual or in paper format)	Political leadership to develop and implement an overarching policy strategy exists in the line ministry. Representatives from other key ministries are also fully committed to contribute at political level to operationalize Article 6.

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
	Target: An operational manual developed in all participating countries which defines the ITMO implementation procedures.		
Outputs			
Outputs to achieve Outcome 2 3.1 Article 6.2 strategy developed to reflect the latest knowledge, experiences and practices at international level. 3.2 ITMO operational manual developed to operationalize the Article 6.2 strategy and regulate the development and implementation of mitigation activities. 3.3 National stakeholders fully engaged and consultations conducted.		-	-
Outcomes	**Outcome Indicators**		
Outcome 3 Cooperation between host countries and buying	**4.a** ITMO processes harmonized and streamlined and cooperation	**4.a** Records of events. **4.b** Links to success stories.	Countries are actively using the virtual platform to align processes with other participating countries' processes and

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
countries enhanced and awareness of countries about Article 6.2 increased.	facilitated between and among countries. **Baseline:** Processes not established and streamlined across countries. **Target:** All participating countries will engage in at least 1 global and 1 regional joint awareness raising event per year to share knowledge and success stories. **4.b** Success stories communicated and disseminated. **Baseline:** No success stories developed and dissiminated. **Target:** At least 1 success story per country dissiminated in English and the national (UN) language, where applicable.		are contributing to joint events and willing to share their experiences and success stories with a wider audience.
Outputs			
Outputs to achieve Outcome 3 4.1 6 success stories developed and shared. 4.2 Disseminated best practices and lessons		-	-

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
learned at national/regional and global level through 2 awareness raising events.			
Outcomes	**Outcome Indicators**	-	-
Outcome 4 ITMO project cycle operationalized.	Hands-on support provided to allow countries active 'learning by doing' throughout the project implementation with the goal to fully operationalize the ITMO project cycle. **Baseline:** No ITMO projects under implementation. **Target:** At least 1 ITMO project per country initiated (identified/developed/implemented) with support of the KliK Foundation.	Meeting reports/records of meetings/evidence of ITMO project implementation processes applied.	Countries are working closely and effectively with the KliK Foundation to ensure ITMO project development and implementation is initiated.
Outputs		-	-
Outputs to achieve Outcome 4 1.4 Training materials developed. 1.5 Excel based registries developed and utilized.		-	-

Strategy of Intervention	Key Performance Indicators	Means of Verification	External Factors (assumptions)
1.6 ITMO project implementation processes initiated in each country. 1.7 Responsibilities of key national stakeholders defined and effectively executed. 1.8 At least 4 targeted trainings per country for 4 key user groups conducted.
